

Inya.ai Buildathon – Concept Note Template

Stage 1: Ideate, Build & Amplify

Team Name: MedScheduler AI Team

Submission Deadline: 4 Aug 2025

File Name: MedSchedulerAI_ConceptNote.pdf

Proposal Link: https://raw.githubusercontent.com/speedily/cosmics/3599007f6c5cb81683e237e581a4092fc4cef4c/MVP_PROPOSAL.pdf

1. Team Details

Team Name: MedScheduler AI Team

Member Names & Roles: - Abhishek Jha (Team Lead & AI Agent Developer)

[Additional team members to be added]

Contact Email: helloabhishekjha@gmail.com

2. Problem Statement

What problem are you trying to solve?

Healthcare appointment scheduling is currently plagued by inefficiency, manual processes, and poor resource utilisation. Hospitals struggle with coordinating doctor availability, room allocation, and patient preferences, leading to long wait times, no-shows, and suboptimal resource utilisation.

Why is this problem important? Who faces this challenge?

This problem affects millions of patients and healthcare providers daily. Patients face 3-4 week wait times for specialist appointments, while hospitals experience 40% resource underutilisation. The challenge impacts: - **Patients:** Delayed access to care, poor experience, increased health risks - **Healthcare Providers:** Inefficient resource utilisation, administrative burden, reduced patient satisfaction - **Healthcare Systems:** Increased costs, reduced capacity, poor emergency response coordination

3. Proposed AI Agent

Agent Name: MedScheduler AI

Brief Description:

MedScheduler AI is an intelligent healthcare appointment scheduling agent that orchestrates the entire appointment lifecycle. It makes autonomous decisions about resource allocation, patient

prioritisation, and care coordination using advanced AI algorithms. The agent handles patient registration, intelligent slot selection, priority-based scheduling, automated communication, and real-time conflict resolution.

Key Differentiator:

Unlike existing scheduling systems that simply automate tasks, MedScheduler AI makes intelligent, context-aware decisions. It considers medical urgency, patient history, resource availability, and geographic factors to optimise scheduling. The agent can handle emergency cases with priority override, predict no-shows, and dynamically reallocate resources in real-time. Our 4+ years of healthcare technology experience and published research in medical systems provide unique domain expertise that ensures the AI understands healthcare complexities.

4. Industry & Use Case

Target Industry: Healthcare & Medical Services

Expected Business Impact:

- **Cost Reduction:** 40% reduction in administrative overhead, 30% decrease in no-shows
 - **Time Savings:** 50% faster appointment booking process, 60% reduction in scheduling conflicts
 - **Better Customer Experience:** 24/7 availability, personalised scheduling, automated reminders
 - **Resource Optimisation:** 25% improvement in doctor and room utilisation
 - **Operational Efficiency:** Real-time resource management, automated communication workflows
-

5. Inya.ai Agent Link

Agent URL: [To be generated after building the agent on Inya.ai platform]

6. Social Media Promotion

Social Media Amplification Efforts:

Our team will promote the MedScheduler AI project across multiple platforms to showcase the potential of AI in healthcare and engage with the healthcare technology community.

Engagement Table:

Platform	Post Link	Impressions	Likes	Comments
LinkedIn	[Insert LinkedIn post link]	[Insert]	[Insert]	[Insert]
Instagram	[Insert Instagram post link]	[Insert]	[Insert]	[Insert]
Twitter	[Insert Twitter post link]	[Insert]	[Insert]	[Insert]

Social Media Strategy:

- **LinkedIn:** Professional healthcare technology posts, industry insights, project updates - **Instagram:** Visual content showing AI agent workflow, healthcare impact stories - **Twitter:** Real-time updates, hackathon progress, healthcare innovation discussions

7. Optional Bonus

Wireframe / Flow Diagram:

Future Roadmap: Post-hackathon development will include advanced features like predictive analytics, hospital system integrations, emergency response systems, and multi-location support to create a comprehensive healthcare orchestration platform.

This concept note leverages our team’s 4+ years of healthcare technology experience, including the AIIMS, Rockefeller Grant-winning KMES.in project and published research in the Cardiology Society of India Bengal Heart Journal, to create an AI agent that truly understands healthcare challenges and can make intelligent decisions to solve them.
